# Home Screen

Both Android & iOS would follow this screen layout

- Android would potentially have the menu bar on the top, whereas iOS would have it on the bottom as depicted

The colors and text are not the actual elements that would be used.

- The names are only placeholders so we can get a general idea of how it would appear in the actual app

- The colors are only used to indicate different elements that are considered to be important and follow colors that are often used in practice

Cardio PreOp

- Here is one idea for the walkthrough process. As an after thought, the last screen on the next page could be a good way to show to show the results after all the questions have been answered by appending them beneath the last questions.

  - How the **No**, **Yes**, **Start Over** buttons are displayed is not necessarily the best, there are likely better solutions that you can use.

  - The True and False icons are their to indicate which option the client had selected and I believe they should be included so the client can glance over it to make sure they selected the correct options. If changes need to be made, they should be able to select on the icon to change it and they would restart the process from that point on (possibly?).

- There are two options for the other walkthrough process; the next step takes a three screen approach.
